

AMENDMENTS TO THE SPECIFICATION

Please amend the specification at paragraph [0019] as indicated below:

[0019] FIG. 1 illustrates an external-issue-search user interface for searching an external-issue database, according to one embodiment. The user interface allows searching for external issues that may affect testing of a new product. The search criteria may be based on a field, such as a product or project name 102, a device 104, a platform 106, a browser 108, and an area 110, for example, which relate to software and hardware entities that may operate in conjunction with the new product. Searches are executed by filling in the appropriate filed or fields 102, 104, 106, 108, 110, 112, 114, and 116 and then selecting a submit button 118. Alternatively, to enter a new search, the clear form button 120 may be selected to clear previously entered search criteria.
